

Final Project Requirements.

Project Overview

The project should be a functional website.

There is no need to host the website on any hosting platform.

You should Implement

- user authentication/ authorization
- displaying data from the back end into the front end.
- responsive
- upload your project code as a zip file to github or Black board
 - if you use github add me as a collaborator to check the code if it is a private repo, if it's a public repo, just shar the link with me :D

Requirements

the project should contain

- front end
 - html
 - css (bootstrap, tailwind, or your own css)

- js
- backend
 - express
 - mongodb
- security
 - using JWT
- dynamic
 - ejs

Note: You can use any similar technology for example you can use sqlite3 instead of mongodb, pug instead of ejs etc..

Presentation

At the end you need to present the project, this means I need to see the working website and ask a couple of questions. Be prepared and happy hacking :)
